Release notes

Table of Contents

When new releases of the AI-Framework are released, the update will be described in these articles.

What releases do

A release often means that new features are added to the AI-Framework. The model of existing software does not need to be changed. However, a software developer may decide to use the new feature when this involves an easier solution to a problem. When there are bug fixes, they may involve a new compilation of existing software.

See What happens when new versions of the AI-Framework are released?

Content of release notes

Release notes are described with the following chapters.

- New features.
  Describes new statements or other features.

- Improvements.

Describes changes in the code of the AI-Framework, that have lead to improvement of for example performance (speed).

- Bug fixes.
  Describes bugs that are fixed, and when needed steps that need to be taken to implement this in existing software.

Download of releases

In the future, each article describing a release note will also contain a link where customers can download the release.
