What it is

EnumNvlExpression is used specify how to treat a NULL value in a Enum property (or field or variable). If the Enum appears to be NULL, it will be assigned a default value or a specified value.

- See [LINQ](#) for details about LINQ and the AI-Framework.
- Go to the category for [all LINQ expressions](#).

Code example

```
public ReadOnlyEnumProperty EnumNvlExample{ get { return CalculatedEnumProperty(() => Operation.EditItem.TaxType.Nvl(TaxDefault)); }}
```

Explanation of the example

The example above works as follows.

- Line 1 defines a ReadOnlyEnumProperty with the name EnumNvlExample.
- In Line 5 and 6 the content of this property is going to be calculated and assigned.
- In line 6, the Enum Operation.EditItem.TaxType is evaluated, by adding .Nvl.
- If the Enum appears to be NULL, then EnumNvlExample will be assigned the value after Nvl between parentheses. In this case, the Enum TaxDefault will be assigned.
